

AMENDMENTS TO THE SPECIFICATION:

Please amend the specification as follows.

Please replace the “ABSTRACT” with the following paragraph:

This invention refers to peripheral equipment of a computer and is a wireless and passive tablet for inputting to the computer that converts the track of handwriting to digital X, Y coordinates and then inputs it to the computer and then displays the track if the tablet on screen of the computer directly with corresponding driver program and application software. The characteristic of the wireless and passive tablet is using the coil of X, Y direction in transmitting and receiving, in the concrete, MCU2 chip generates A square wave is generated and inputs input to a transmitting circuit,[[, the]] A transmitted electromagnetic wave transmitted is inputted to a circuit of a pen to form resonance that will be outputted to a receiving circuit. The receiving circuit connects to an amplifying circuit to amplifies amplify the signal and input the amplified signal into a phase angle detecting circuit and an amplitude detecting circuit respectively to control the phase angle and amplitude. And then the signal is inputted to a primary CPU through integral and A/D conversion to realize the writing function of the wireless pen finally.
